Conexus Wealth: logo print colour test

How to use this sheet

1. Print at 100% / Actual size (not 'Fit to page'), ideally on the same printer or press and paper the client will use.
2. Turn off any printer colour 'enhancement'. If the print dialog offers it, let the application manage colour.
3. Judge the prints in daylight or under a neutral light, not next to a screen. Screens will not match paper.
4. Pick the version that reads as purple (not navy) at both sizes. Then use the grid on the last page to fine-tune the solid colour.
5. Write down the letter (and grid cell, if used). Those CMYK values become the official print colours.

A Baseline: standard automatic conversion

What a normal RGB to CMYK conversion produces (Generic CMYK). Cyan is about equal to magenta, which is why it prints blue.

Solid colour fine-tuning: 'Wealth', the X triangles and the 73.89% stop

Pick the patch that looks most like the purple the client wants. Use it for 'Wealth', the X triangles and the 73.89% gradient stop so they match. Top grid: Y5 K15 (deeper). Bottom grid: Y0 K5 (brighter).
